Flexpower specification

User research

Ideas

Discussion

Next Steps & Collaborations

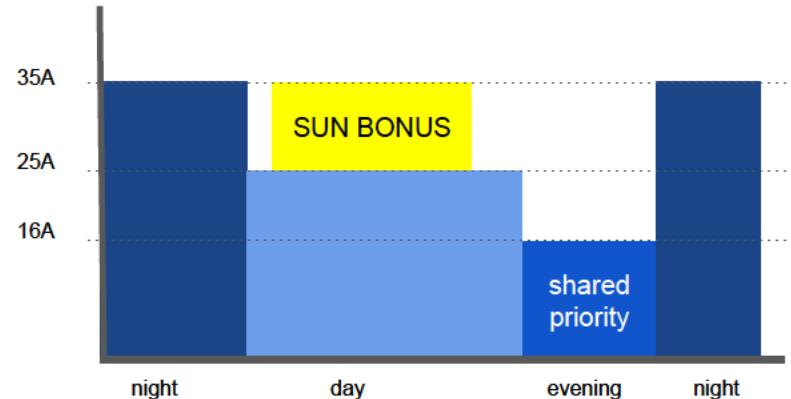

Summary

- There is no specification yet. (right?)
 - Impact of ‘fellow charger’ can be so profound that it cancels out ‘smartness’
 - ‘Smartness’ has little effect on single phase, 16A cars.
-
- These effects impact the user experience, and therefore the design.

Assumptions

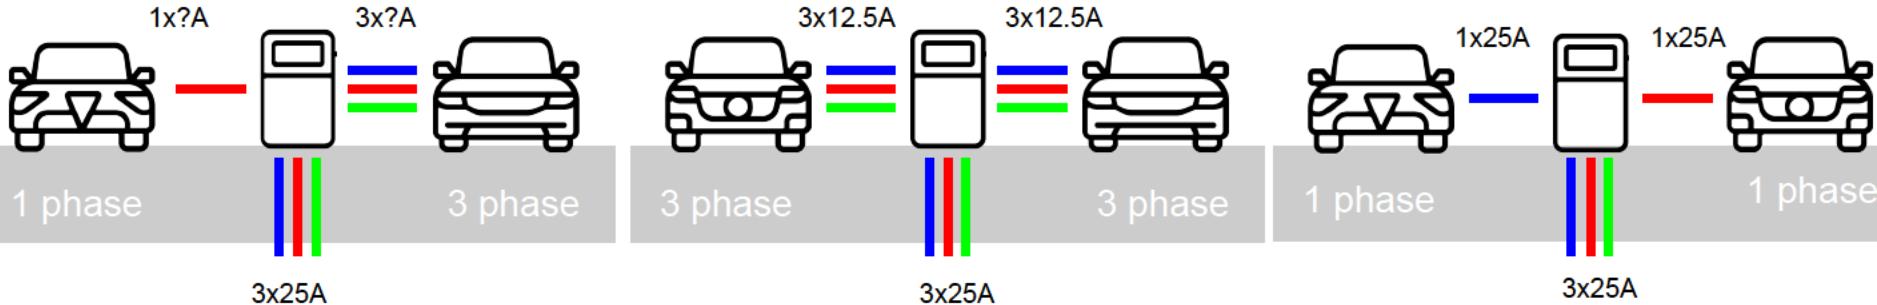

1. Flexpower has 3 levels: 16, 25, 35A
2. Shared cars can only be prioritised at peak hour
3. Sun Bonus...
 - a. ... only occurs between 9:00 - 18:00
 - b. ... is predetermined each day.
 - c. ... can only be 10A.
4. Power distribution
 - a. Cars cannot charge below 6A, so dynamic switching is necessary
 - b. Some cars can charge a maximum of 32A and others a maximum of 16A.
 - c. Every charging station gets the same power, which the station divides between max. 2 cars.
 - d. We can exclude 2-phase charging.

32A bleek later 32A te zijn.
De zonnebonus is dan 7A

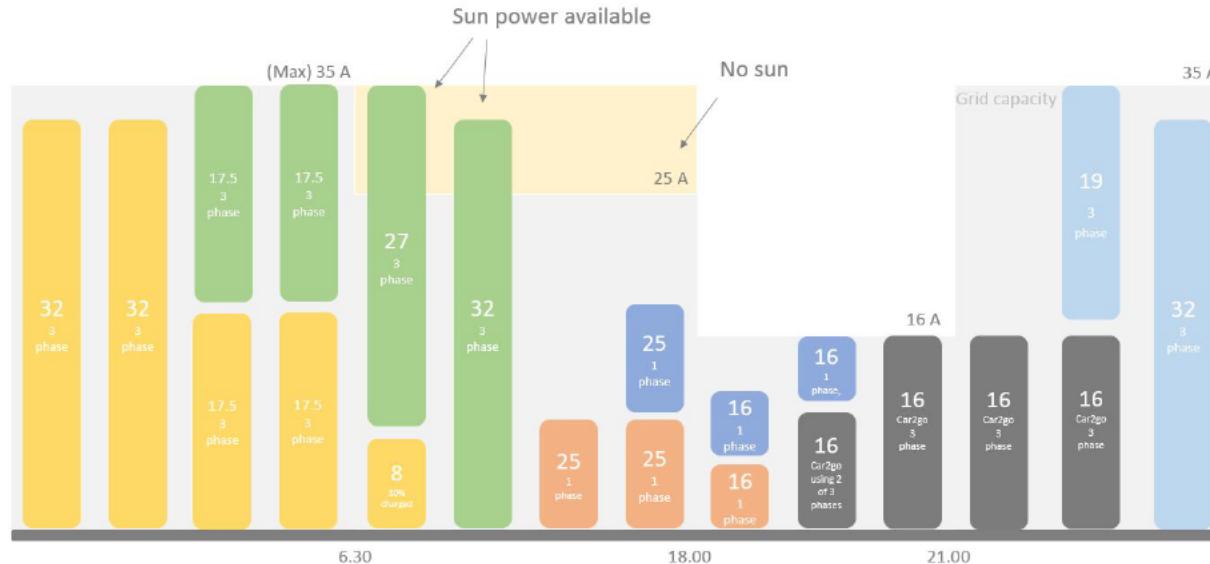

Standard charging stations

Each charging station has 3 phases and usually 2 charge points per station. Standard charging stations can deliver 25A per phase. Most cars can either charge using 1 phase or 3 phases. Two single-phase cars can use one phase each and could theoretically charge at 25A, although most cars charge at a max of 16A. Two 3-phase cars will split the power per phase and will each charge at 12,5A per phase.

Car variables

Cars differ in the number of phases they use to charge and the maximum at which they can charge. They will have different battery capacities and mileage ratios. Some cars will also charge the remaining 20% at a lower rate. This creates many variables that influence the rate at with your car can charge and how to evaluate a fair distribution.

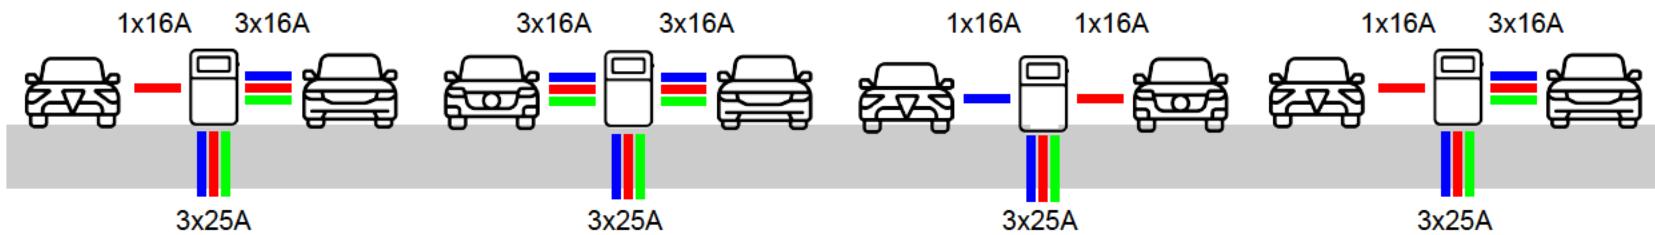

dit was ons idee van hoe de paal werkte, maar niet alles in dit overzicht komt overeen met de praktijk.

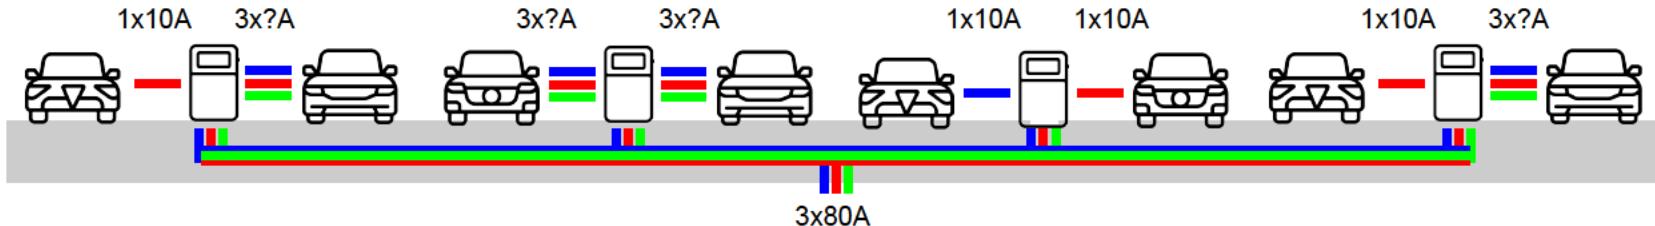

Raamplein

The 4 charging stations on Raamplein currently have a connection each, meaning they can independently provide up to 3x35A. It is therefore not a true charging square (laadplein) where a single connection could deliver up to 3x80A. With such a setup all cars would notice a reduced output if more cars would charge.

Current situation at Raamplein

A charging square

Different frictions

The frictions that seem to most prevalent are the amount and type of cars that are charging and the low supply during peak hours. In the current situation this only holds between the two cars that are both using a charging station, not between all 8 cars that can charge there.

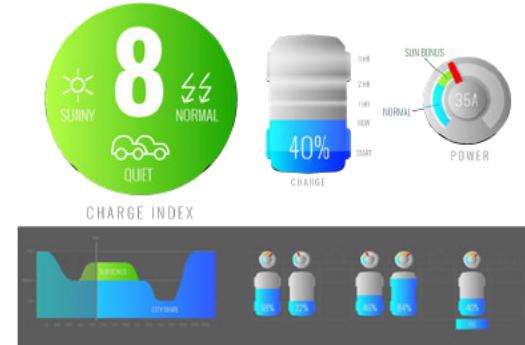

The design solutions might use similar solutions, but might differ quite a bit. To proceed with the design process it would be good to answer this question.

QUESTION:

Do we design the pilot around the current setup and focus on frictions per station or do we design for a charging square?

Compare 2 cars

Compare 8 cars

Distribution rules

Car share advantage	200%	Percentage car shares get compared to normal cars
Phase distribution model	Assign Phase	Distribution model between single phase and 3-phase cars. Split phase: equally divide single phase between cars. Assign phase: fully assign one phase to single phase car and assign remaining 2 phases to 3 phase car. Custom: another model presented by Elaad

When single phase cars share, there is only impact from lower power levels

3 phase car shares can have a large impact because they can command a lot of power

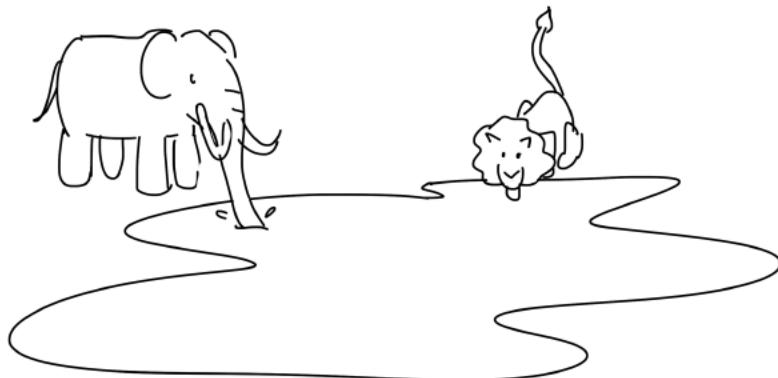

Friction Matrix

		Normal cars		Car sharing		Normal cars		Car sharing			
		1x16A	1x32A	1x16A	1x32A	3x16A	3x32A	3x16A	3x32A		
		Ah	%max	Ah	%max	Ah	%max	Ah	%max	Ah	%max

3x32A	35	64	67%	64	67%	64	67%	64	67%	57	59%
3	25	50	52%	50	52%	50	52%	50	52%	37,5	39%
32	16	32	33%	32	33%	32	33%	32	33%	24	25%

When 3 phase cars share the power levels impact charge rates. The impact is higher because they can charge more

Algorithmic friction

- 3 phase car sharing vehicles can severely impact your charge rate
- Single phase car sharing vehicles have a relatively small impact?
- Cars with higher charging capacity (phases and amps) tend to ‘suffer’ more
 - They cannot charge as much they could and will experience it as slow
- What is fair? Should we find a more neutral metric like mileage?
- ...

Questions about power distribution

- Do 1-phase cars always charge with a maximum of 32A or can this also be 16A? **can do both**
- Do 3-phase cars always charge with a maximum of 32A or can this also be 16A? **can do both**
- How is power divided between a 1-phase and 3-phase car? **They both get the same amount offered by the chargepoint, without considering what they actually can use.**
- How is the power divided when one car is at 80%? **This is still to be decided.**
- What kind of connection do shared cars have? (expectation, 16A with 3-phase) **differs**
- How do Car2go cars get priority? (When sharing with 3-phase and 1-phase car) **yet to be decided**
- What happens when the power from the sun is not as expected? Can it be adjusted later during the day or is other energy used to compensate? **still to be decided**

A photograph of a watering hole in a savanna setting. Five animals are gathered at the edge of a shallow pool of water. From left to right: a large wildebeest, a zebra, a water buffalo, a water buffalo calf, and a young deer. The background shows a dry grassland with some trees under a clear sky.

Discussion Algorithmic friction

Discussion

Algorithmic friction

Het bleek dat het soort auto geen invloed heeft op hoeveel er aangeboden wordt, dus dit is incorrect

- 3 phase car sharing vehicles can severely impact your charge rate
- Single phase car sharing vehicles have a relatively small impact.
- Cars with higher charging capacity (phases and amps) tend to ‘suffer’ more
 - They cannot charge as much they could and will experience it as slow
- What is fair? Should we find a more neutral metric like mileage?

Flexpower specification

User research

Ideas

Discussion

Next Steps & Collaborations

Research

1. When, why, and how can we engage EV-drivers with the Flexpower algorithm?
2. How should we intervene in the public space and place the monitor?

Outcome Scenario for projected experience

Research

- Site visit + interview
- 5 in-depth interviews with EV-drivers (read [here](#))
- Paper prototype

Insights EV-Drivers

1. There is **limited attention** in the charging process
2. Drivers need information about their ‘treatment’ **before** charging, not after.
3. Smart charging is acceptable as long as it does not drastically **limit mobility**.

#1 — Limited attention

- **Low interest** The initial interest in understanding the algorithms seems low
- **Limited attention** Drivers indicate that they do not pay attention to any information outside of:
 - the lights on the charging station
 - the dashboard of the car
 - the car app
- **Cognitive overload** Drivers' stories of charging in a public space seem to suggest that there is quite a cognitive load and perceived stress that might make it difficult to turn their attention to something else

#1 — Limited attention

“I doubt if knowing the algorithm makes sense,
there’s probably nothing that can be done about it”
- Rob (40), Outlander hybrid

“I get so much information every day, I assume it
will be fine”
- Karen (48), e-Golf

“I only pay attention to the info when something
went wrong”
- Karen (48), e-Golf

“I have a love-hate relationship with charging. (...) It
happens that I stand there like an ass (klojo)”
- Rob (40), Outlander hybrid

“As long as it is charged, I don’t need to know
more”
- Dirk-Jan (36), Tesla Model S

#2 — Information before charging is key

- Drivers express a need to be informed before they start charging of their ‘treatment’.
- Drivers want to know how much they can charge in what period of time
- This means that the station will have to do a ‘prediction’ of some kind. It will have to give an impression to the driver of what he or she can expect in the coming hours.

#2 — Information before charging is key

“If you don’t know beforehand, I think that’s punishment according to criteria you knew nothing about. Dat would give me a feeling of unfairness, because I did not get to make a choice. That’s not really transparent to me.”

- Rob (40), Outlander hybrid

“I would like to know beforehand, yes. (...) Getting the information afterwards does not seem useful to me”

- Karen (48), e-golf

“I want to know what I can expect. Not really why but how much I can charge. To know for the next time.”

- Janneke (19), e-golf

“Yeah of course, i’d like to know up front so I can then maybe skip that station and look for another one”

- Dirk-Jan (36), Tesla Model S

#3 — Acceptability of smart charging

- Drivers express that smart charging is fine, as long as it does not limit their own mobility
- Not knowing what to expect hurts the trust in charging station
- Not knowing how much you can charge evokes a lot of negative emotions in drivers

#3 — Acceptability of smart charging

“As long as I get to where I need to go without too much trouble all is fine by me”

- Karen (48) e-golf

“I can understand prioritization, as long as it doesn’t become some kind of class-system”

- Roelof (45) Tesla Model S

“If I do not charge enough that would be total sh*t. I could really make a fuss about that”

- Rob (40), Outlander hybrid

“You mean if other people charge before me? If there is no good reason then that really is injustice.”

- Dirk-Jan (36), Tesla Model S

Insights Raamplein

- The space does **not** lend itself to the **placement of a single screen** to explain the design
- The space is not a true charging **square**; a screen per station is probably more fitting

Insights Raamplein

- The space does **not** lend itself to the **placement of a single screen** to explain the design
- The space is not a true charging **square**; a screen per station is probably more fitting

Placement of a single screen

The space does not naturally guide users next to the charging station to a centrally placed screen between the charging stations:

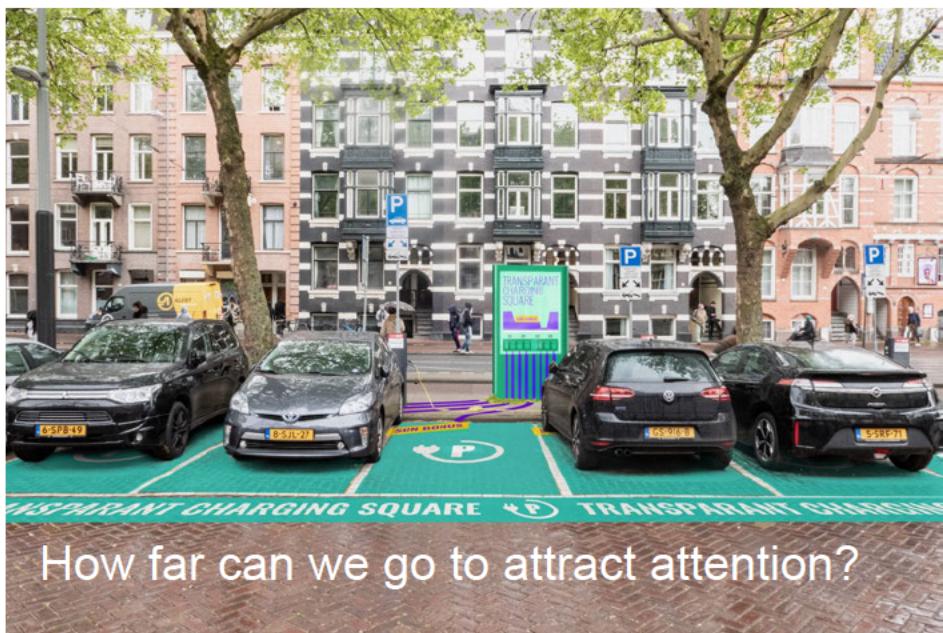

- The viewing angle from the different charging stations makes it difficult to look straight at the screen (more likely to see the sides)
- Trees and traffic signs block or compete for attention in the field of view
- The distance to the screen from the outer charging points is around the width of 3 parking spots, which might require the screen to be quite large in order to be identified

Again, other interventions might be needed to guide users to the screen.

Will it stand out?

Impression JCDecaux style screen

How far can we go to attract attention?

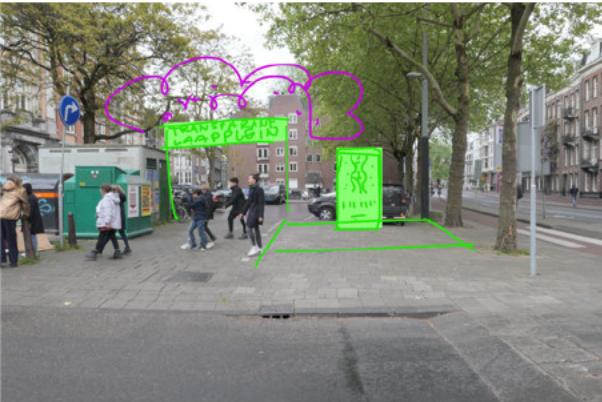

Impression color interventions to guide attention

- A standard screen might not stand out in the environment since it is already quite feature-rich: charging stations, street signs, trees, traffic, decorative architecture all compete for visual attention
- An intervention to attract attention might have to be quite 'loud' to capture the attention of the user. This might not fit the public space and is not very scalable

A screen per charging station

We suggest to not proceed with a single screen as a main direction, but to investigate a screen for each charging station

- A single screen can still be used for explaining the story to the public
- The challenge is still to fit the action of reading the screen into the many steps in the charging flow
- We need to be extra aware of the practical possibilities with regards to sourcing etc

Main screen for the public at the entrance?

Schermen op het raamplein

Om aan gebruikers en voorbijgangers duidelijk te maken wat er allemaal bij flexpower komt kijken zijn schermen nodig. Een scherm per paal is het uitgangspunt, dus er zijn vier schermen nodig op het raamplein. De schermen moeten boven de huidige laadpaal komen te hangen.

Het scherm moet voldoen aan een aantal eisen:

- internet verbinding mogelijk
- kiosk/browser mogelijk
- hoog contrast
- vandalisme proef
- weersbestendig
- eventueel touch
- tussen 12 en 21 inch (dit is flexibel)

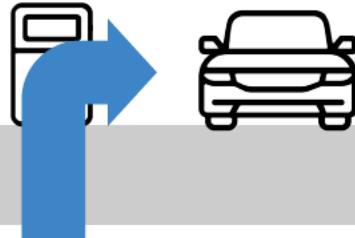

Division of power by the chargepoint*

*chargepoint might give more than the car can use

Alone

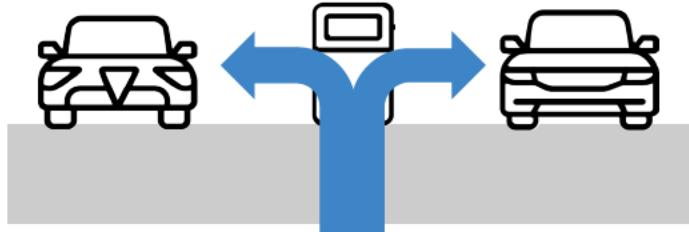

You get **all** the power available

Best option

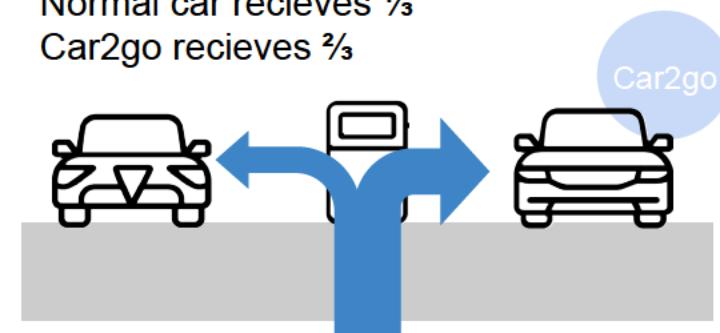

With two

You get **half** of the power available

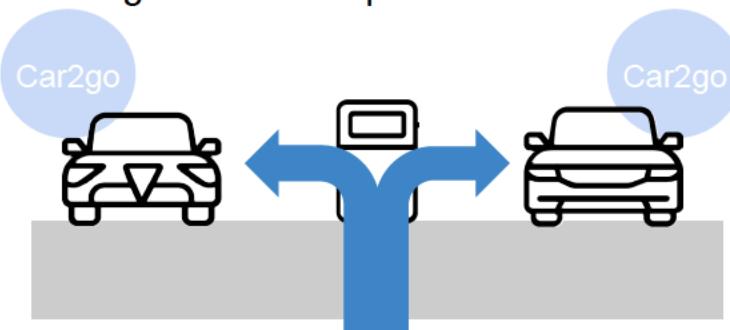

With Car2go

Normal car receives $\frac{1}{3}$
Car2go receives $\frac{2}{3}$

With two Car2go

You get **half** of the power available

What does this mean for me?

Alone

16A available

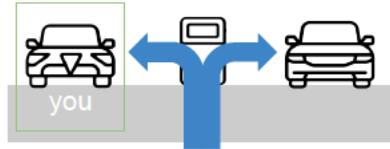

25A available

32A available

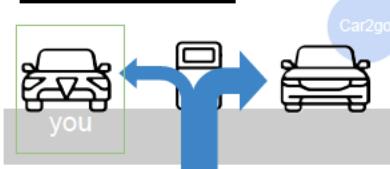

With two

when you
are a **16A**
car

when you
are a **32A**
car

Next to Car2go

are a **16A**
car

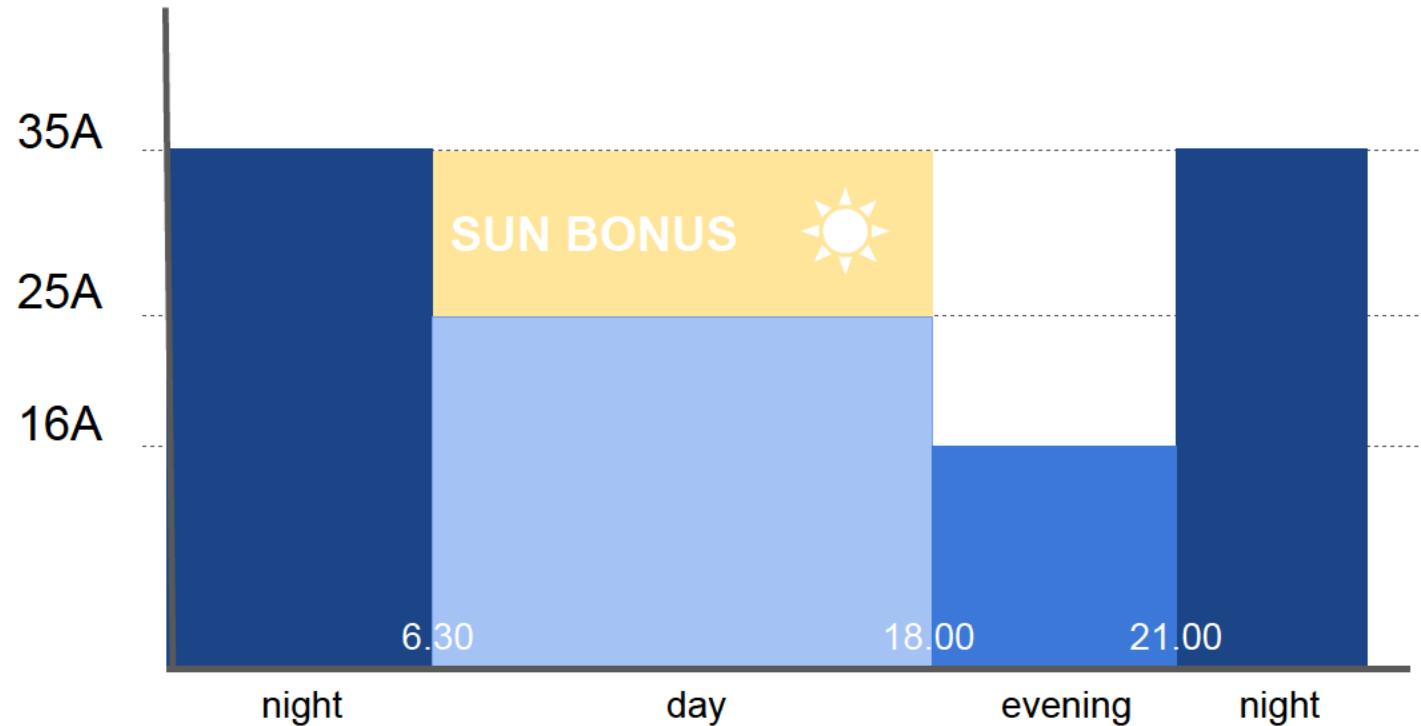

when you
are a **32A**
car

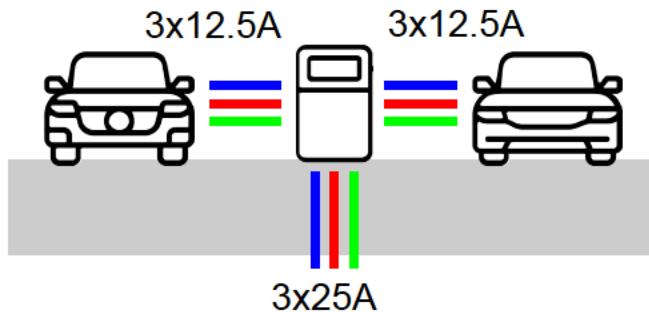

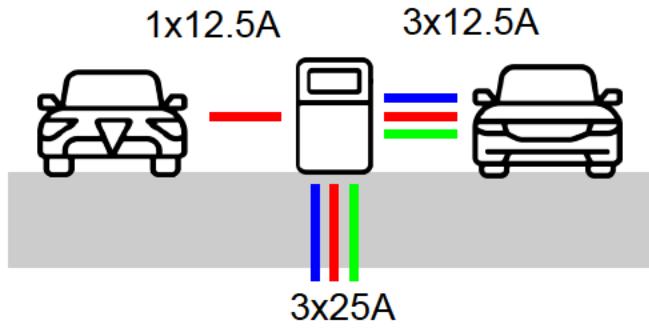

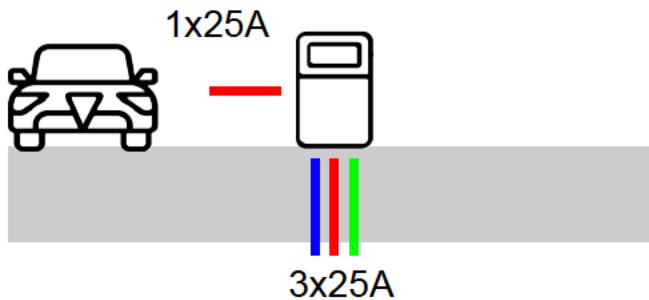

when you
are a **16A**
car

when you
are a **32A**
car

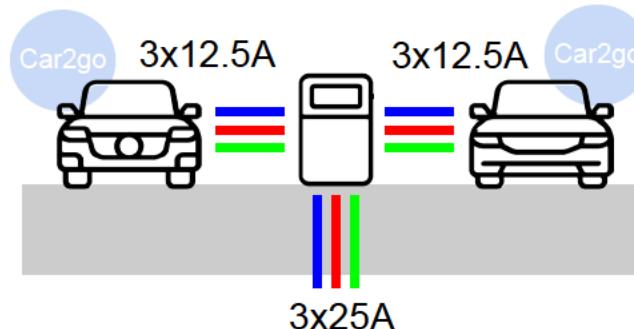

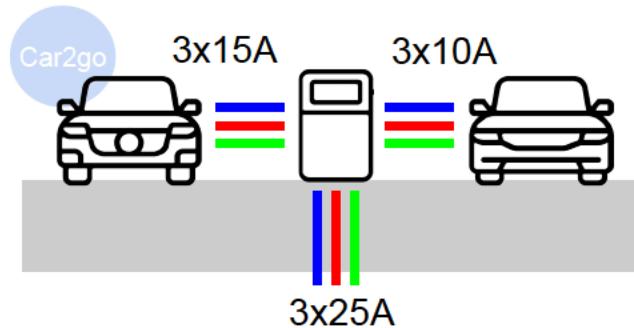

Power available

Technical version of
powerdivision

When charging alone, you can use everything that is available. When sharing the ChargePoint with another car the power will be split. Power is split per phase. The ChargePoint will offer both cars the same, whether it can use it or not. Sharing with a Car2go is the exception on this rule. Than the power will be divided differently.

Influence of other cars on charging speed

	16A		25A		32A		alone
	sharing with normal car	sharing with Car2go	sharing with normal car	sharing with Car2go	sharing with normal car	sharing with Car2go	
16A Car	8A half speed	6A lower than half speed	12,5A higher than half speed	10 higher than half speed	16A full speed	12A higher than full speed	Full speed
32A Car	8A half speed	6A lower than half speed	12,5A half speed	10A lower than half speed	16A half speed	12A lower than half speed	Full speed
Car2go 16 A	10A higher than half speed	8A half speed	15A nearly full speed	12,5A higher than half speed	20A more than full speed, so will charge at 16A	16A full speed	Full speed
Car2go 32 A	10A higher than half speed	8A half speed	15A higher than half speed	12,5A half speed	20A higher than half speed	16A half speed	Full speed

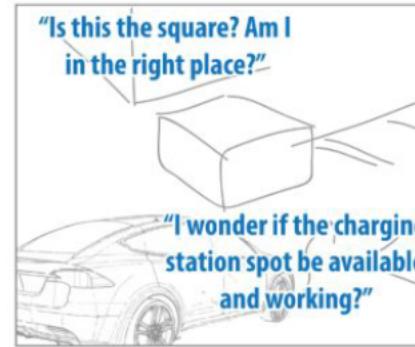

The charging speed is rated in comparison to what the car would charge in this situation, when it did not have to share.

Storyboards

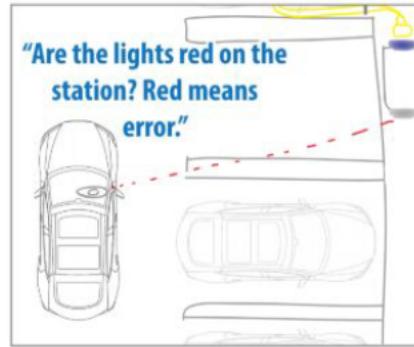

Storyboard 1:current situation

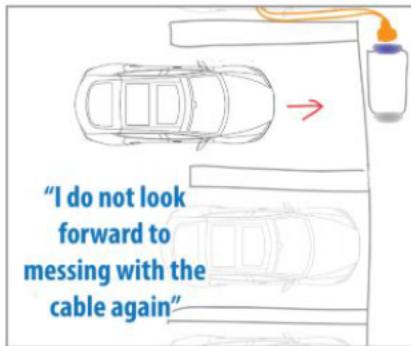

1. EV-driver consults the car or her app where to find a charging spot.

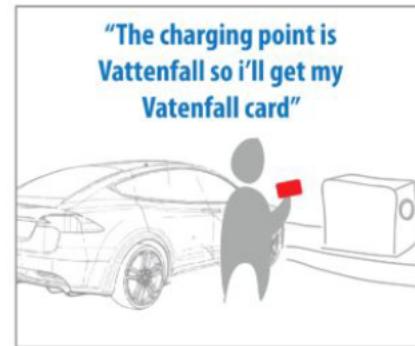

2. She navigates to the Raamplein and looks for the spot.

3. She checks from a distance if the charging spot is active and working.

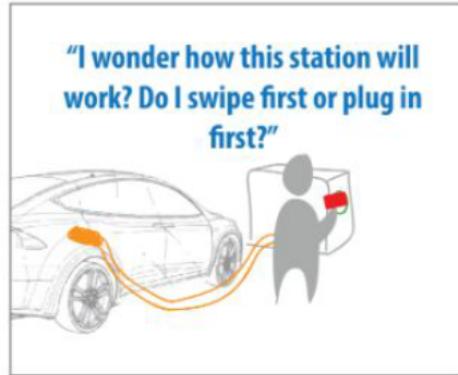

4. She parks the car in a suitable spot.

5. She takes a suitable chipcard and exits the car.

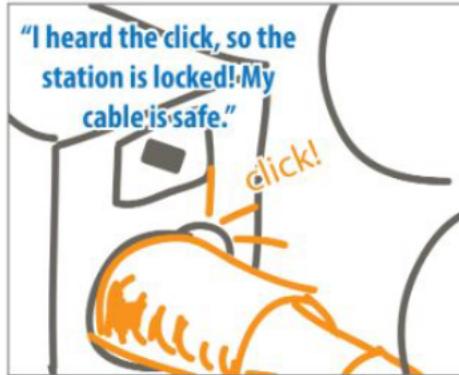

6. She gets her charging cable from the trunk.

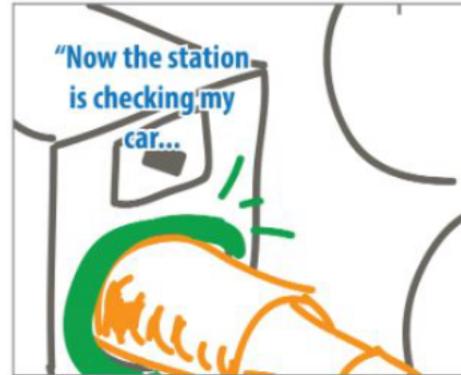

"I wonder how this station will work? Do I swipe first or plug in first?"

7. She plugs the cable in his car, walks up to the station and executes her usual routine.

"I heard the click, so the station is locked! My cable is safe."

8. She plugs in her cable and listens for the click.

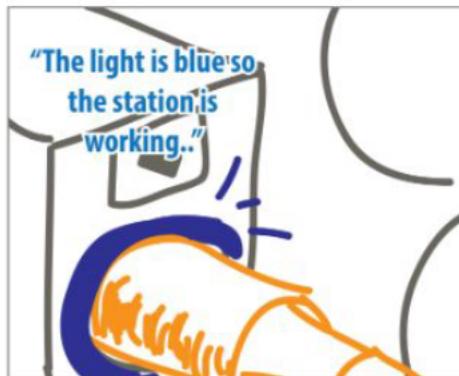

"Now the station is checking my car..."

9. She checks for the green light.

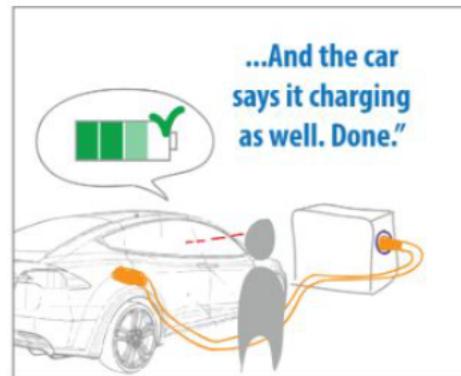

"Now I swipe and wait for the beep!"

10. She swipes her card and waits for the beep.

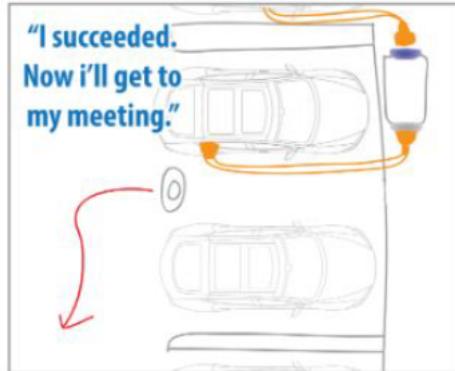

"The light is blue so the station is working..."

11. She waits for the light to turn blue.

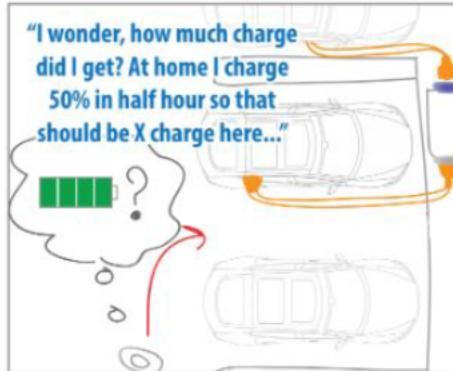

...And the car says it charging as well. Done."

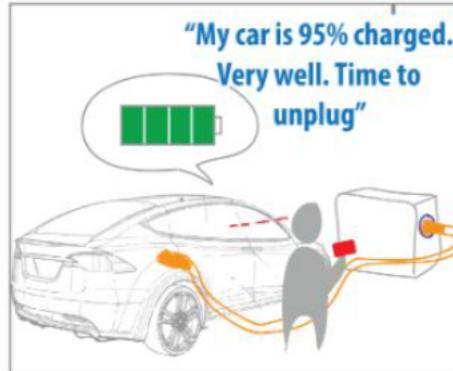

12. She returns the card to the car, and checks in the car if the car is charging.

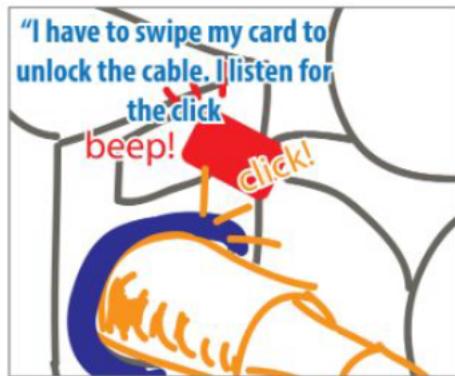

13. She locks the car and walks away.

14. She returns to the car wondering whether it has charged properly.

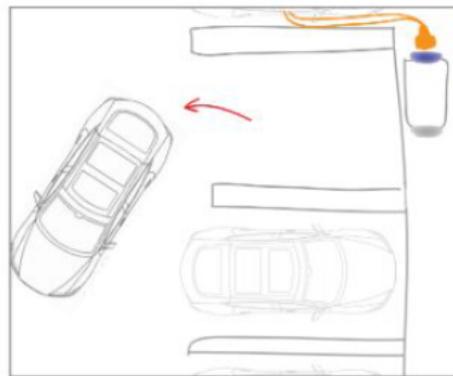

15. She returns to car, opens the car, checks if the car is charged and gets the correct card from the car.

16. She swipes the card and removes the cable.

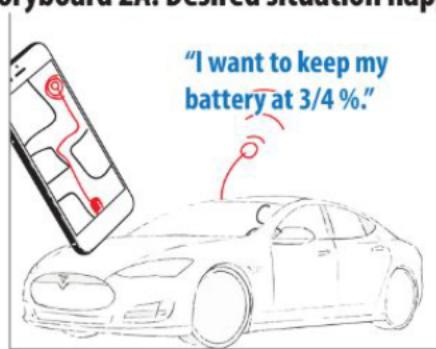

17. She returns the cable to the trunk.

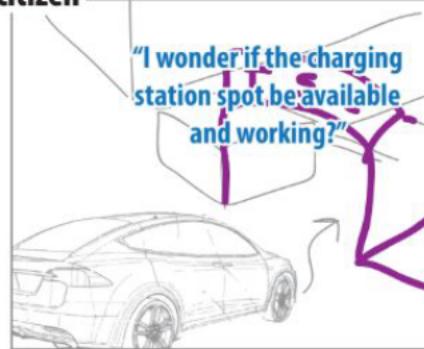

18. She enters car and drives away.

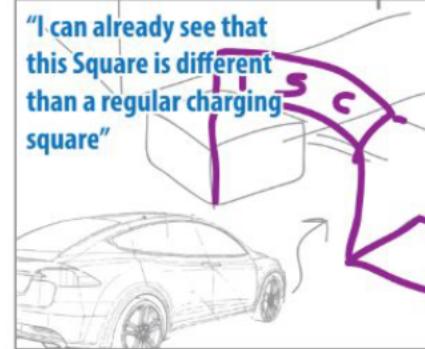

Storyboard 2A: Desired situation happy citizen

1. An EV-driver consults the car or her app on where to find a charging spot.

2. She navigates to the Raamplein and looks for the spot.

3. She can clearly see the Raamplein and where to go.

3. She can see from a distance if a station is working and roughly how much charge she'll get out of it.

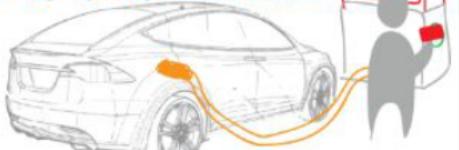

4. She parks the car in a suitable spot.

5. She takes a suitable chipcard and exits the car.

"I wonder how this station will work? Do I swipe first or plug in first?"

Oh, I see that the screen has step-by-step instructions."

6. She reads the info on the screen on how to charge, and transparent charging.

"I heard the click, so the station is locked! My cable is safe."

click!

7. She plugs in her cable and listens for the click.

"Now the station is checking my car..."

8. She checks for the green light

"Now I swipe and wait for a confirmation..."

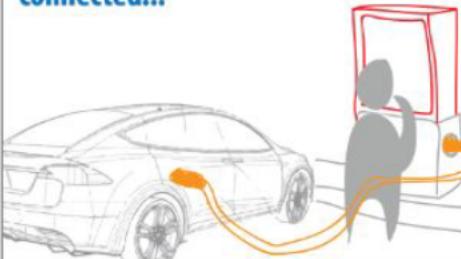

beep!

"Let's check on the screen if my car is properly connected and all is well..."

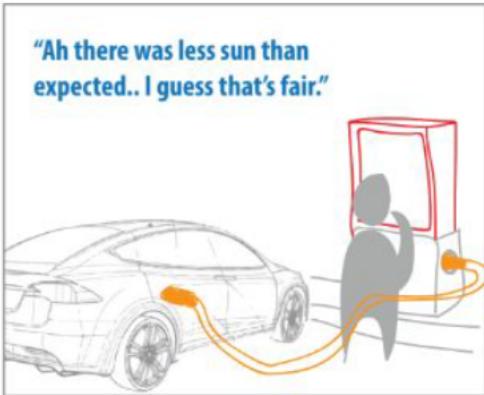

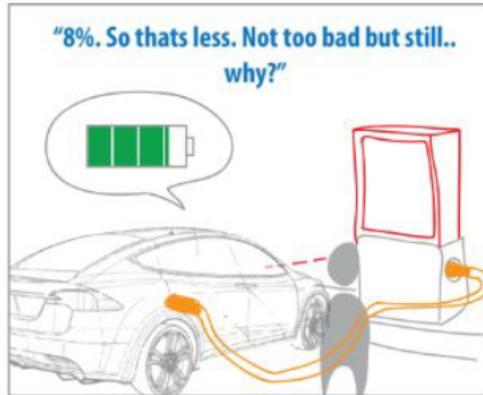

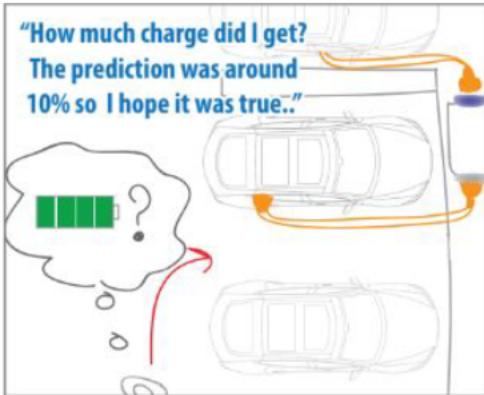

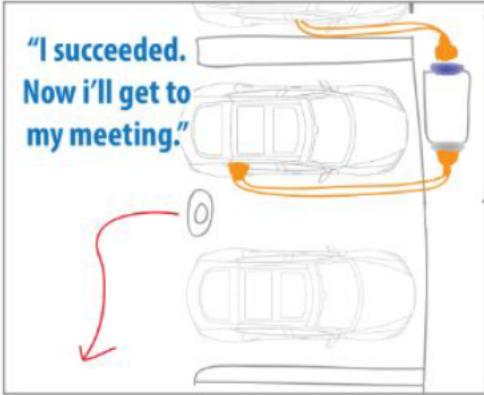

9. She swipes her card.

10. She waits for the blue light.

"The screen tells me that all is well and connected..."

11. She looks at the screen and sees that all is well and connected.

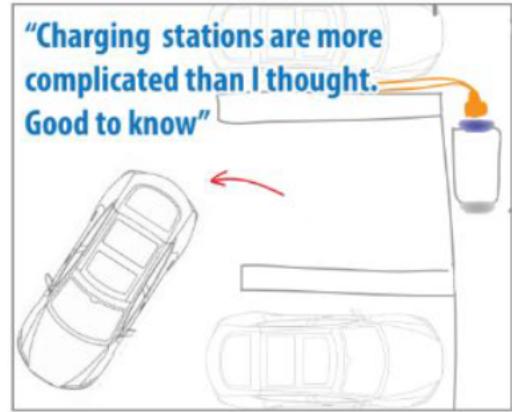

18. She swipes the card and removes the cable

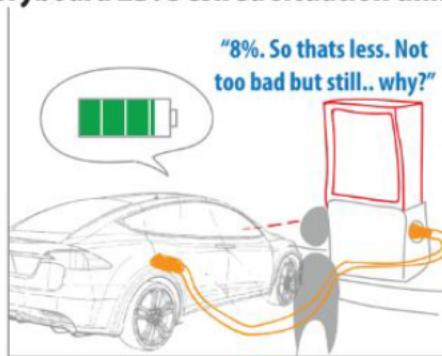

19. She returns the cable to the trunk.

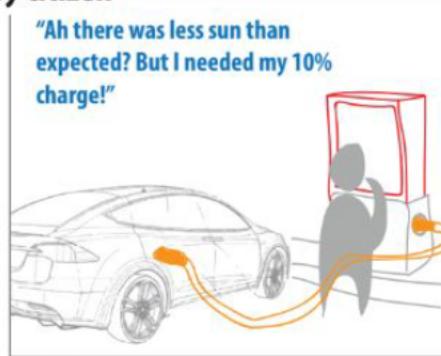

20. She enters car and drives away

Storyboard 2B: Desired situation unhappy citizen

1-15 unchanged >>

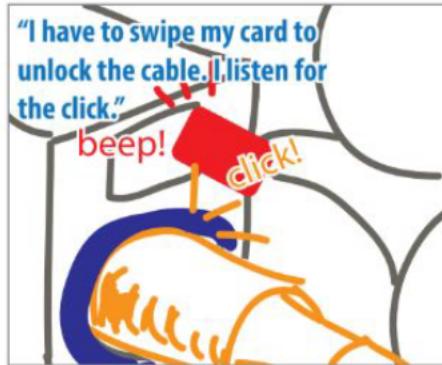

16. She checks the charge level in the car.

17. She checks the screen for an explanation.

18. She checks the screen for an explanation.

18. She swipes the card and removes the cable

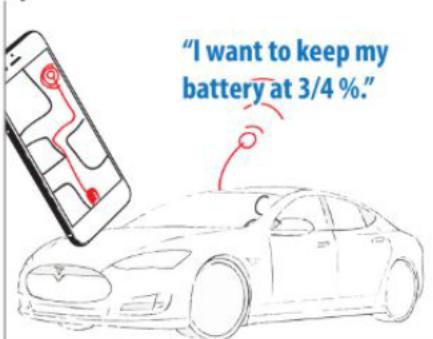

19. She returns the cable to the trunk.

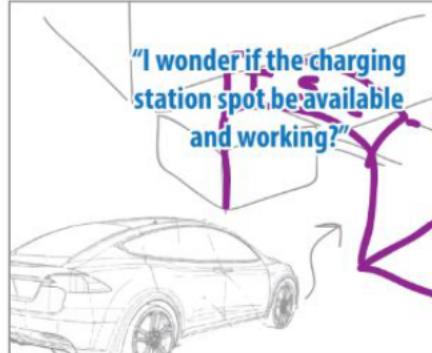

20. She enters car and drives away

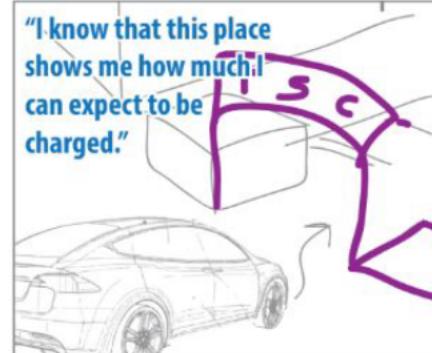

Storyboard 3: Further visits

1. An EV-driver consults the car or her app on where to find a charging spot.

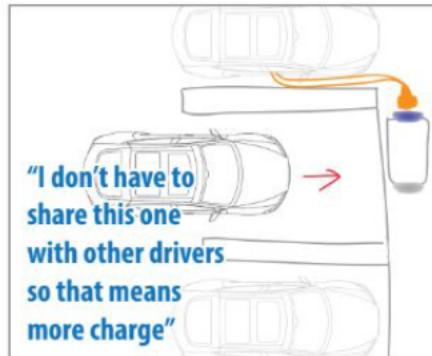

2. She navigates to the Raamplein and looks for the spot.

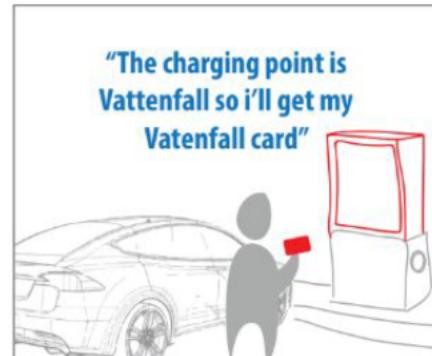

3. She can clearly see the Raamplein and where to go.

3. She can see from a distance if a station is working and roughly how much charge she'll get out of it.

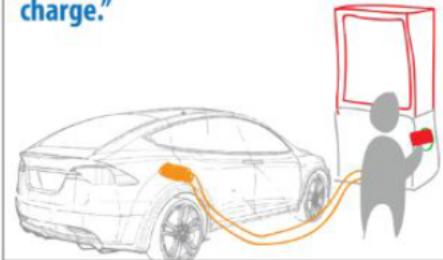

4. She parks the car in a suitable spot.

5. She takes a suitable chipcard and exits the car.

"I know how this station works.
Let me double-check the expected
charge."

6. She reads the info on the screen on
how to charge, and transparent
charging.

"I heard the click, so the
station is locked! My
cable is safe."

7. She plugs in her cable and listens
for the click.

"Now the station
is checking my
car..."

8. She checks for the green light

"Now I swipe and
wait for a
confirmation..."
beep!

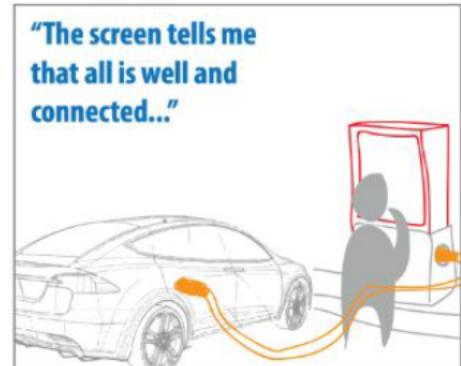

9. She swipes her card.

"Let's check on the
screen if my car is
properly connected
and all is well..."

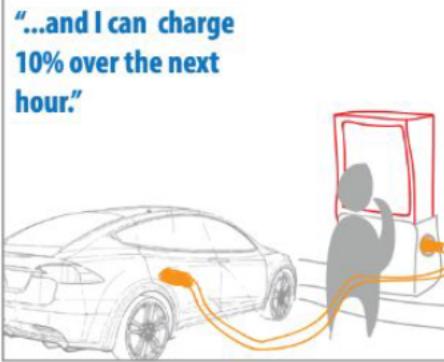

10. She waits for the blue light.

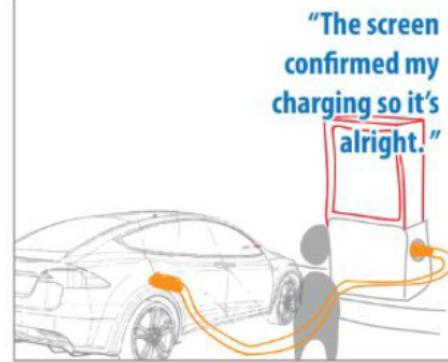

"The screen tells me
that all is well and
connected..."

11. She looks at the screen and sees
that all is well and connected.

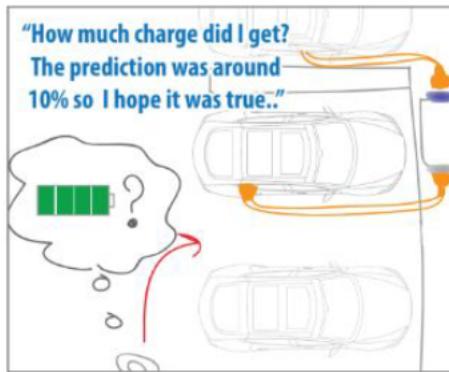

12. The screen tells her an estimation of charge.

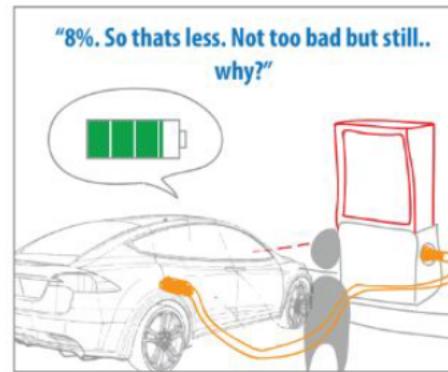

13. Having been reassured by the screen, she only briefly checks the car.

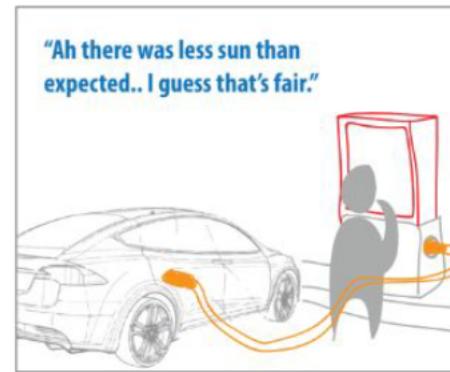

14. She leaves to do what she has to do.

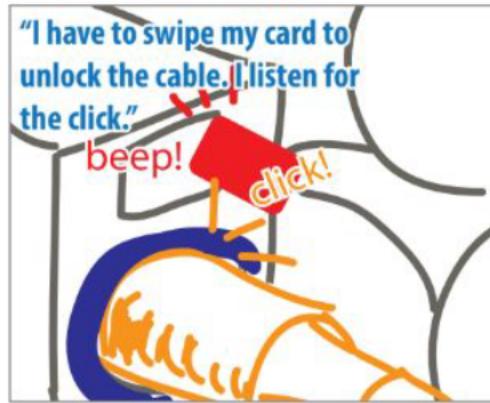

15. She returns to the car after her activity.

16. She checks the charge level in the car.

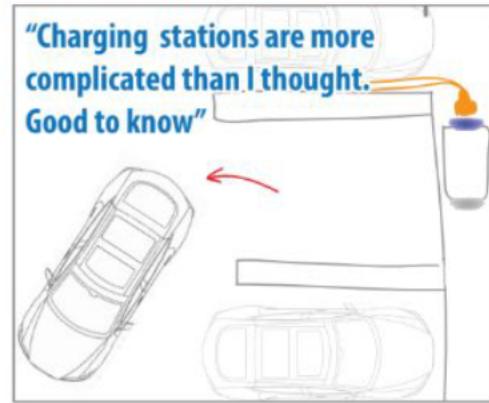

17. She checks the screen for an explanation.

18. She swipes the card and removes the cable

19. She returns the cable to the trunk.

20. She enters car and drives away

Flexpower specification

User research

Ideas

Discussion

Next Steps & Collaborations

Main considerations

1. Previous TCS showed how the algorithm defined the **planning**, whereas Flexpower 2 is an algorithm that distributes energy over all participants at **any given moment**.
2. It is not about understanding fairness by comparing your treatment to that of fellow chargers, it is about whether you think the (choice for) parameters and weights is fair.
3. We design for users and citizens, not for what *we* find interesting or important.

Transparency

Algorithm — computation / logic

Outcome — distribution of resources (TCS 1)

Your situation — how your capabilities are affected

Parameters — what is looked at to craft

Reasons — and omit computation

Concept 1

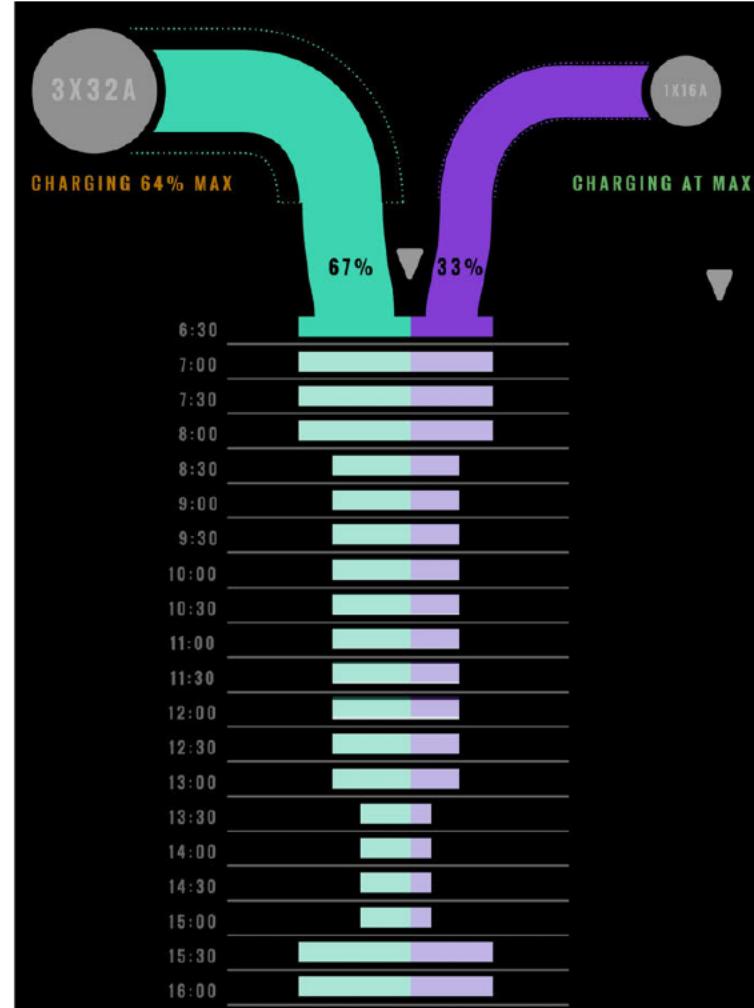

— Marble Machine

By taking the idea of marbles we make an algorithm intuitive.

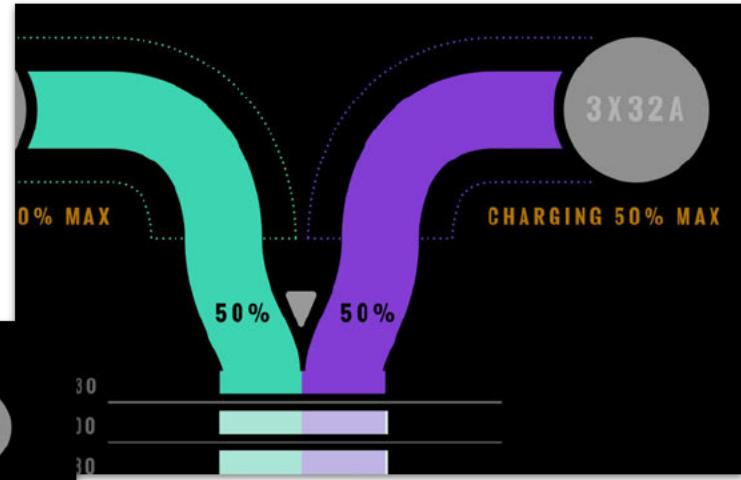

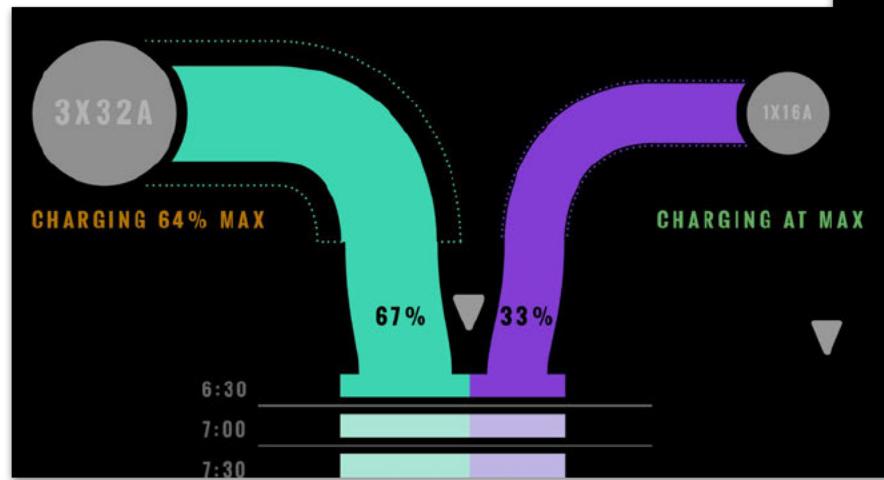

Concept 2 — Tetris+

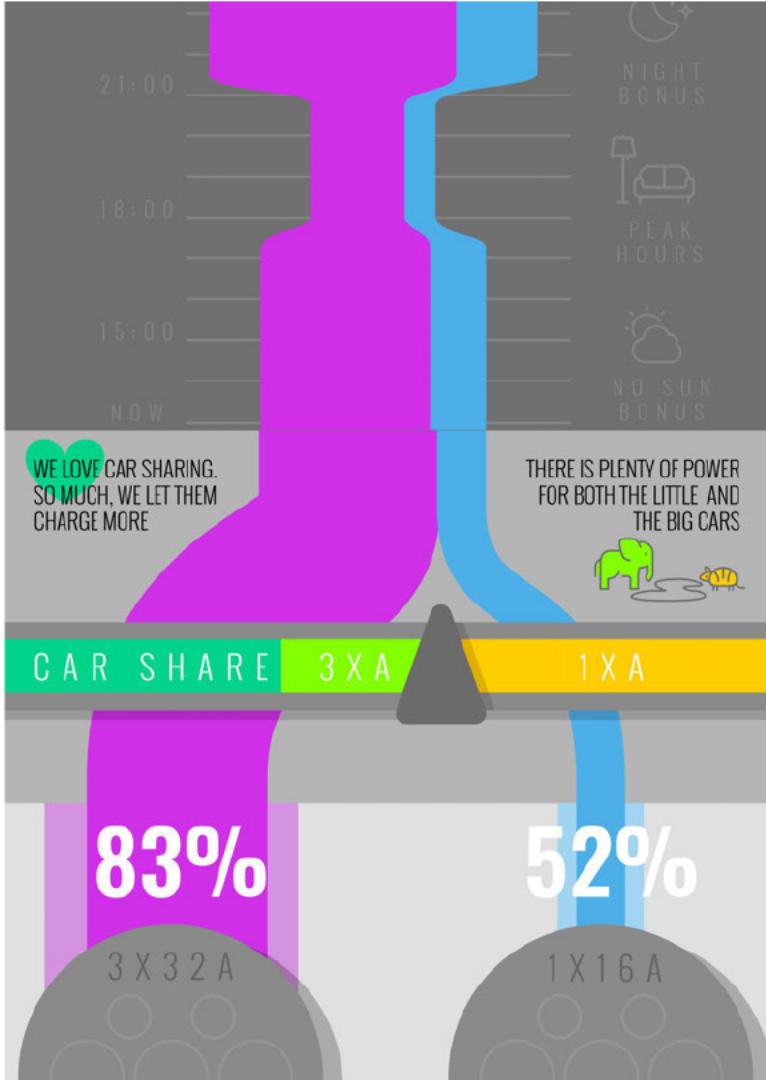

A newer version of the TCS design.

Concept 2 — Tetris+

Concept 2 — Tetris+

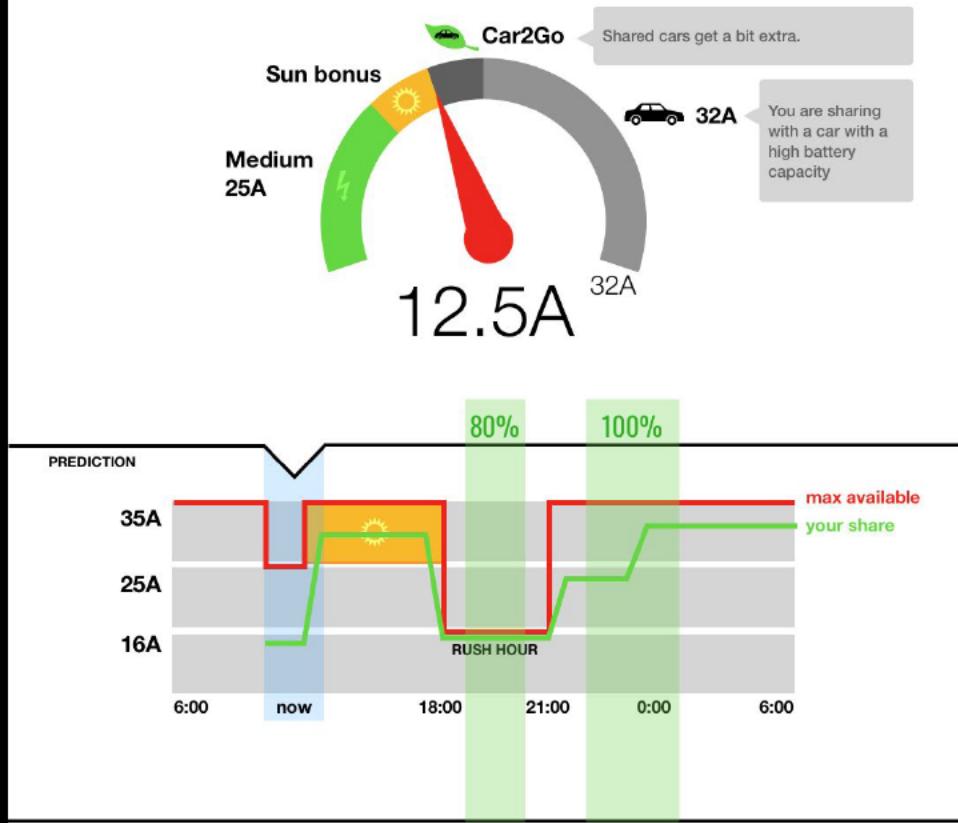

Concept 3

— Speed-o-matic

Here we show to what extent you can charge at your maximum speed. Often you will find some factors limiting this speed, like fellow chargers, lack of sun today.

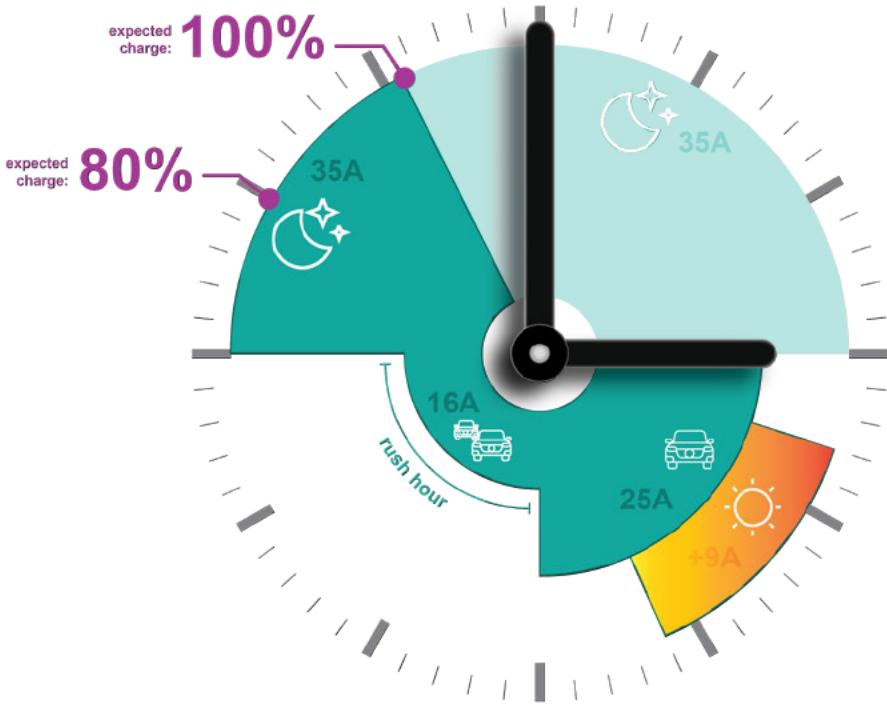

Amsterdam Elektrisch

Concept 4 — Clock

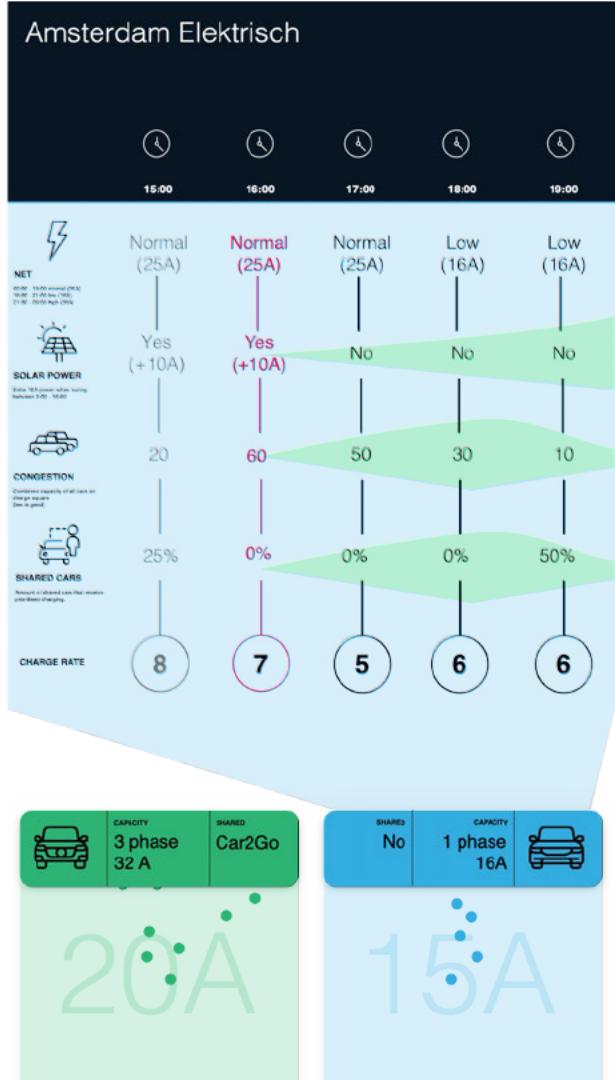

Immediately demonstrate the amount of energy is not fixed, but changes over time. This should make planning easier.

CHARGE SCHEDULE

Concept 5 — Weather report

Here we obscure the complexity of the algorithm, but we show what factors have an influence, and whether you are in for an ok treatment.

Concept 6 — Story

Amsterdam Elektrisch

Right now, we can charge you at 75% of your max. rate. Expected charge: 80% in 2hrs and 100% in 3hrs.

You are sharing 35A (max) with another car, that is a high capacity shared car.

Rates will go down to 16A in 2 hours, and you will be sharing 90% of the time. So that's not ideal.

Want to know more?
Scan this code and
let's chat!

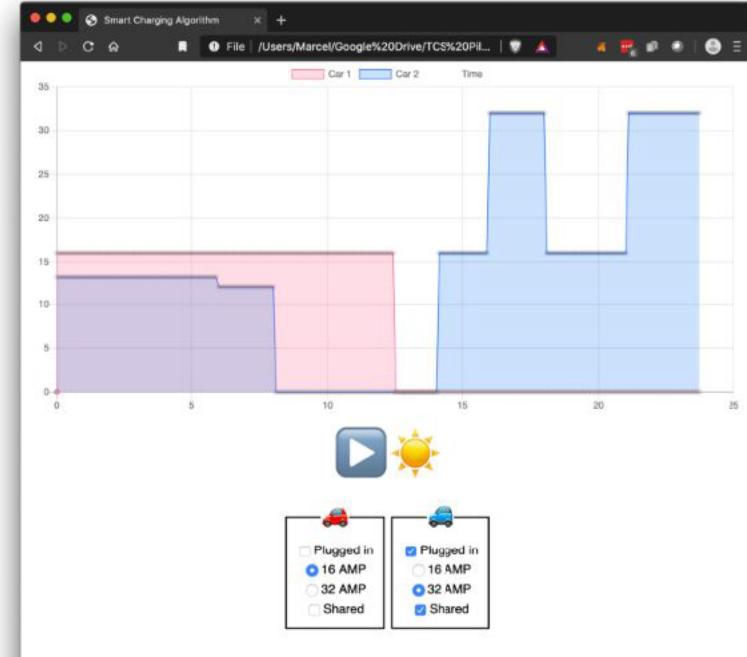

Feedback (paraphrased)

- User focussed ideas like weather report are more appealing
- We can't be too abstract (story), but also don't make it a puzzel (marbles)
- What is the noodrem, what is the bonnetje?

(New) Key considerations

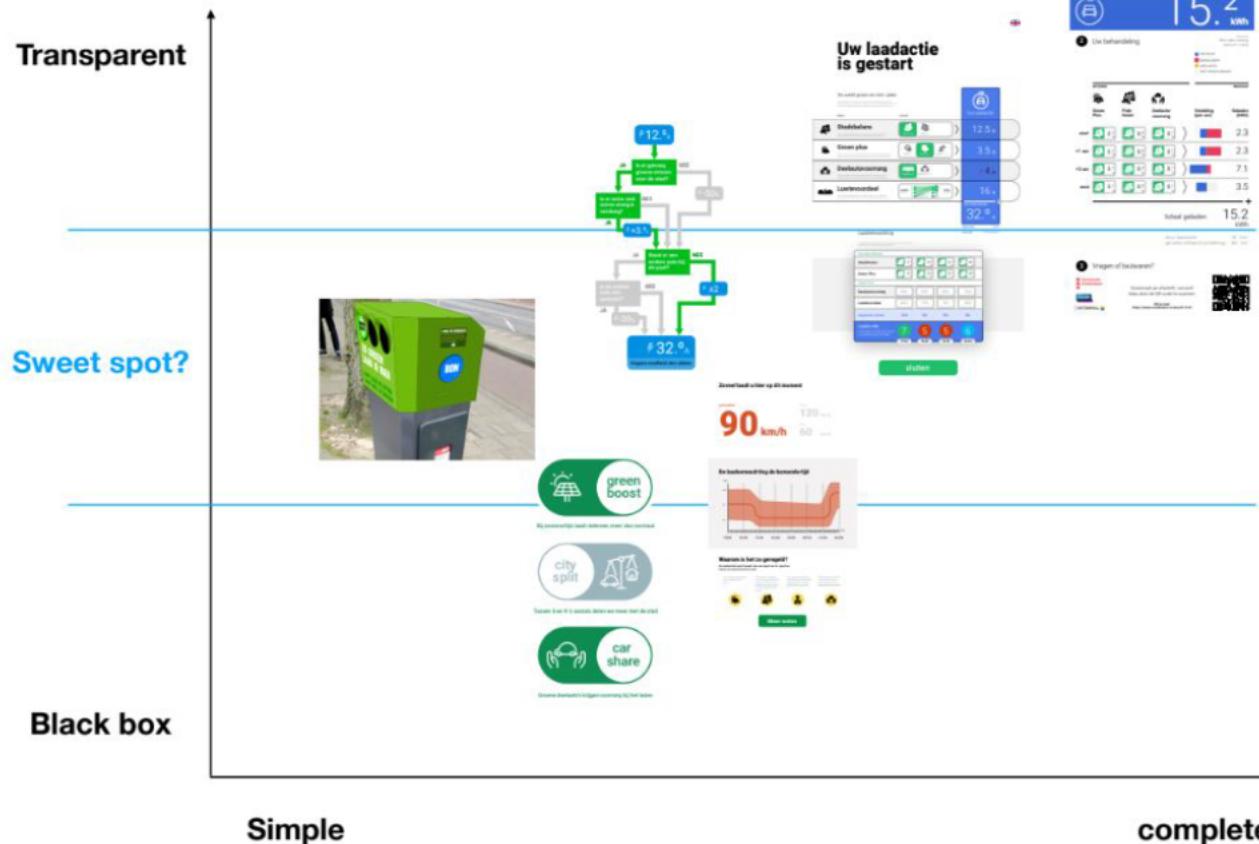

1. Provide user *right* information at the *right* moment:
 1. Idle: *Something is happening here; something different*
 2. Initiate: *How much can I charge in the next x hours*
 3. End: *How much did I charge?*
2. Assume only basic 'graph-decoding' skills, and limited motivation to do so
3. Always emphasise that charge depends on certain conditions
4. No more comparing

Demo

Considerations

- Time and attention of user is limited
- The algorithm we want to convey is quite complex
- There are very few design patterns that are known
- Designing and testing of a complete explanation that is legible is time-intensive
- Simplifying the explanation could undermine the agency provided to users

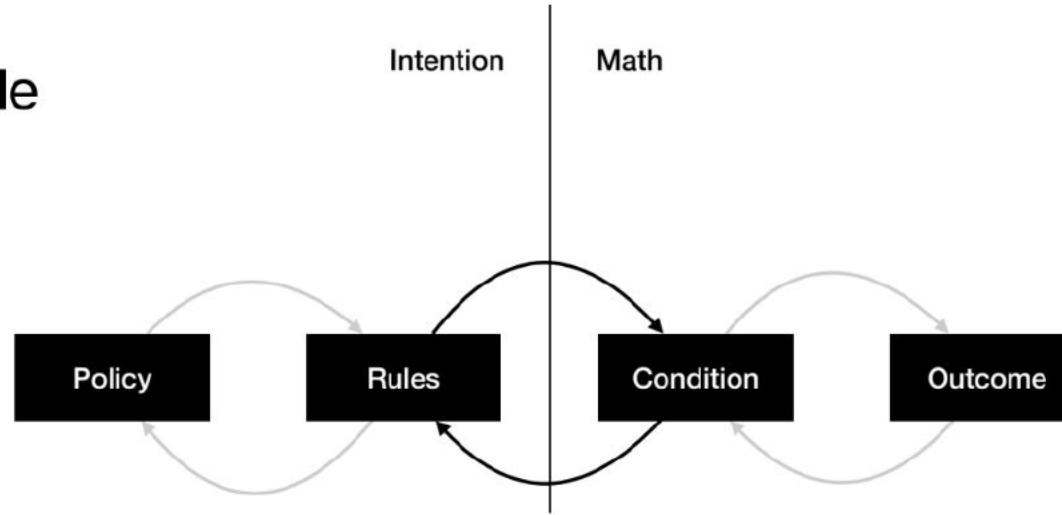

CONCEPTS

Patterns

1. Rules
2. Calculation
3. Receipt
4. Weather
5. Tetris

The rule

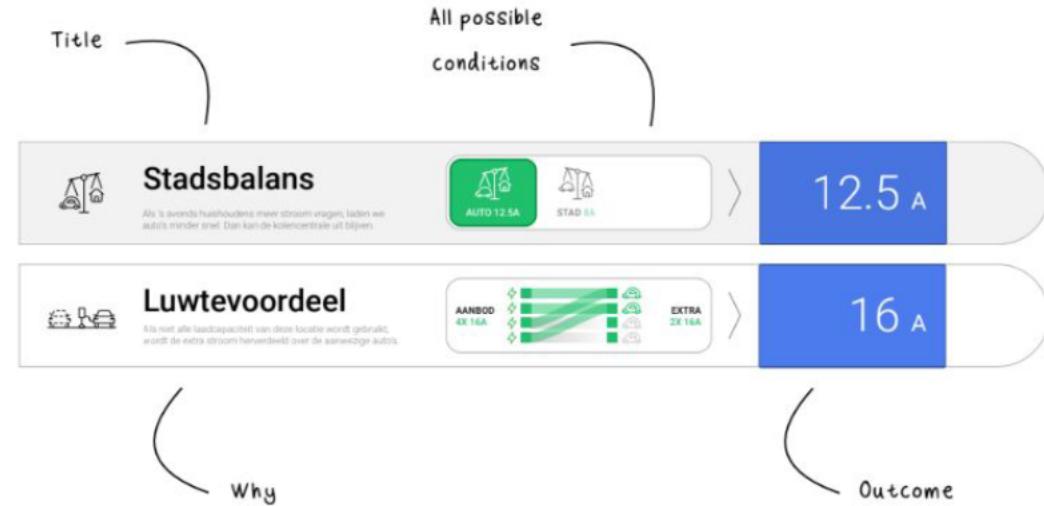

Do these rules reflect the intention behind the policy

Do these conditions capture the context in which the right rule is applied?

Does the math produce the desired outcome?

The rule

Close mapping of
'math' and intention,
with a clear outcome.

An electric driver is looking for a place to park and charge in Amsterdam. The dashboard shows options and leads her to the Raamlein.

On arrival she notices a large gate that announces the parking spot as a smart green charging space. A traffic light with all green lights is lit up.

Before parking, she notices all the charging stations have their own traffic light. The one where a car share is plugged in has two green lights, the others just one.

She picks an empty station, because she has an intuition that this is better for charging faster at a public station.

After hooking up the car, she checks the app to see that the car is actually charging way faster than expected. Her intuition proved to be right it seems.

Later that day, she returns to her car. She sees a car share plugged into the station and a second light on the traffic light. She checks the app and sees that the charge is quite a bit lower than before.

She sees the receipt button and tries it out, just to see what was going on. It prints the receipts with the complete charging timeline for her car.

After reading the receipt she understands that she has more than enough charge. The explanation about giving priority to car shares makes sense to her. The initial high charge was a solo bonus. Good to know!

Hier laadt u nu smart én groen, dankzij...

... ons slimme laad-algoritme. Een paar simpele regels zorgen ervoor dat we zoveel mogelijk hernieuwbare energie gebruiken en deelauto's vaak beschikbaar zijn.

REGEL 1 Groen Plus

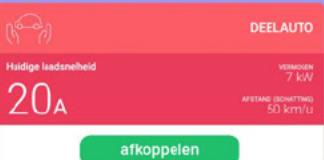

Dit betekent dat u hier sneller kan laden op een dag met veel wind of zon (alleen tussen 21:00 en 18:00).

REGEL 2 Piek-limiet

Dit betekent dat tussen 18:00 en 21:00 — wanneer de stad veel energie vraagt — iedereen iets langzamerlaadt.

REGEL 3 Deelauto-voorrang

Door het dienen van een laadsessie met een deelauto, haalt de deelauto 50% sneller. Zo zorgen we dat een deelauto snel weer gebruik kan worden.

Uw laadactie is gestart

Maximaal groen

If there is more sun or wind than normal, we use the excess to charge your car with extra green energy.

→ 4A

Deelautovoortgang

Once a shared car is available again, it charges 50% faster.

→ 0A

Lage vraag voordeel

If not all the capacity of this location is used, the energy is distributed over more cars.

→ 0A

Your charging speed

Not all cars can be charged.
We charge based on personal priority.

A moment ago also.

16A

Charging forecast

The forecast (1-10) is based on available energy and expected traffic to charge extra fast or slow due to low demand.

By smartly charging your car,
you charge it as green as possible.

Pieke & Dal-uren

If you ask for more green energy during peak hours, your car charges slower.
We only use green energy.

Charging forecast

The forecast (1-10) is based on available energy and expected traffic to charge extra fast or slow due to low demand.

Door uw auto slim op te laden,
laadt u zo groen mogelijk.

Piek & Dal-uren
Als 's avonds huishoudens meer stroom vragen, laden we auto's minder.
snel. Zo gebruiken we alleen groene stroom.

18 - 21 UUR
8A → 12A

Maximaal groen
Als er maximaal veel groene stroom is, gebruiken we het meest
van groene energie om auto's sneller te laden.

ZON 4A → 4A

Deelautovoorrang
Om elke deelauto een duurzame optie zijn, worden ze 50% sneller
opgeladen. Zo zijn deelauto's snel weer op weg.

DEELAUTO → 0A → 0A

Lage vraag voordeel
Als niet alle laadcapaciteit van deze locatie wordt gebruikt, wordt de
extra stroom herverdeeld over wie leeft.

DRIK → 0A → 0A
