

Introductory explanation

Thank you for joining the Axies experiment! The goal of this experiment is to craft a list of personal values that are relevant to a specific context of discussion, and to characterize those values in order to accurately suit the context. The analyzed contexts are based on the opinions of Dutch residents in two Participatory Value Evaluation (PVE) experiments (additional details in a separate document). Within the context of each PVE, we ask you to create a list of values specific to that PVE inspired by the written motivations that participants provided in the PVE.

In the first phase, *exploration*, you will individually read the participants' input and annotate values. In the second phase, *consolidation*, you will discuss with a few other experts to merge the different lists which each of you will have created during the individual exploration. A Natural Language Processing (NLP) powered algorithm will guide you throughout this process.
